## Project 1 SQL COMP9311 23T1

The deadline for project 1 is: Fri 16:59:59 Mar 31st 2023(Sydney Local Time)

#### 1. Aims

This project aims to give you practice in

- Reading and understanding a moderately large relational schema (MyMyUNSW).
- Implementing SQL queries and views to satisfy requests for information.
- Implementing PL/pgSQL functions to aid in satisfying requests for information
- The goal is to build some useful data access operations on the MyMyUNSW database. The data may contain some data inconsistencies; however, they won't affect your answers to the project.

## 2. How to do this project:

- Redissignimenta Project Exam Help
- Familiarize yourself with the database **schema** (description, SQL schema, summary)
- Make a private directory for this project, and put a copy of the **proj1.sql** template there
- You must use the greate state/ments in proj1.sql when defining your solutions
- Look at the expected outputs in the expected of X tables loaded as part of the check.sql file
- Solve each of the problems below, and put your completed solutions into proj1.sql
- the check\_qX(\frac{1}{2}\) indicates \frac{1}{2} \quad \text{CStutores}\$
   Test that your \(\frac{1}{2}\) roj\(\frac{1}{2}\). Sql file will load \(\text{without error}\) into a database containing just the original MyMyUNSW data
- Double-check that your **proj1.sql** file loads in a *single pass* into a database containing just the original MyMyUNSW data
- Submit the project via moodle
- For each question, you must output result within 120 seconds on Nw-syd-vxdb server.
- Hardcode is strictly forbidden.

#### 3. Introduction

All Universities require a significant information infrastructure in order to manage their affairs. This typically involves a large commercial DBMS installation. UNSW's student information system sits behind the MyUNSW web site. MyUNSW provides an interface to a PeopleSoft enterprise management system with an underlying Oracle database. This back-end system (Peoplesoft/Oracle) is often called NSS.

UNSW has spent a considerable amount of money (\$80M+) on the MyUNSW/NSS system, and it handles much of the educational administration plausibly well. Most people gripe about the quality of the MyUNSW interface, but the system does allow you to carry out most basic enrolment tasks online.

Despite its successes, MyUNSW/NSS still has several deficiencies, including:

- no waiting lists for course or class enrolment
- no representation for degree program structures
- poor integration with the UNSW Online Handbook

The first point is inconvenient, since it means that enrolment into a full course or class becomes a sequence of trial-and-error attempts, hoping that somebody has dropped out just before you attempt to enroll and that no-one else has grabbed the available spot.

The second point prevents MyUNSW/NSS from being used for three important operations that would be extremely helpful to students in managing their enrolment:

- finding out how far they have progressed through their degree program, and what remains to be completed
- checking what are their enrolment options for next semester (e.g., get a list of available courses)
- determining when they have completed all the requirements of their degree program and are eligible to graduate

NSS contains data about student courses classes, pre-requisites, quotas, etc. but does not contain any representation of UNSW's degree program structures. Without such information in the NSS database, it is not possible to do any of the above three. So, in 2007 the COMP9311 class devised a data model that could represent program requirements and rules for UNSW degrees. This was built on top of an existing schema that represent the ore WSS data (students, staff, courses, classes, etc.). The enhanced data model was named the MyMyUNSW schema.

The MyMyUNSW database include information that encompasses the functionality of NSS, the UNSW Online Handbook, and the CATS (room allocation) database. The MyMyUNSW data model, schema and database are described in a separate document.

## 4. Setting Up

To install the MyMyUNSW database under your Nw-syd-vxdb server, simply run the following two commands:

```
$ createdb proj1
$ psql proj1 -f /home/cs9311/web/23T1/proj/proj1/mymyunsw.dump
```

If you've already set up PLpgSQL in your template1 database, you will get one error message as the database starts to load:

psql:mymyunsw.dump:NN: ERROR: language "plpgsql" already exist.

You can ignore the above error message, but all other occurrences of ERROR during the load needs to be investigated.

If everything proceeds correctly, the load output should look something like:

```
SET
SET
SET
SET
SET
psql:mymyunsw.dump:NN: ERROR: language "plpgsql" already exists
... if PLpgSQL is not already defined,
... the above ERROR will be replaced by CREATE LANGUAGE
SET
SET
SET
CREATE TABLE
CREATE TABLE
... a whole bunch of these
CREATE TABLE
ALTER TABLE
ALTER TABLE
Assignment Project Exam Help
ALTER TABLE
```

The database loading should take less than 60 seconds on Nw-syd-vxdb, assuming that Nw-syd-vxdb is not under heavy load. (If you leave your project until the last minute, loading the database on Nw-syd-vxdb will be considerable lower that delaying your work even more. The solution: at least load the database Right Now, even if you don't start using it for a while.) (Note that the mymyunsw.dump file is 50MB in size; copying it under your home directory or your /srvr directory is not a good idea).

If you have other large databases under your PostgreSQL server on Nw-syd-vxdb or if you have large files under your /srvr/YOU/ directory, it is possible that you will exhaust your Nw-syd-vxdb disk quota. Regardless, it is certain that you will not be able to store two copies of the MyMyUNSW database under your Nw-syd-vxdb server. The solution: remove any existing databases before loading your MyMyUNSW database.

#### **Summary on Getting Started**

To set up your database for this project, run the following commands in the order supplied:

```
$ createdb proj1
$ psql proj1 -f /home/cs9311/web/23T1/proj/proj1/mymyunsw.dump
$ psql proj1
... run some checks to make sure the database is ok
$ mkdir Project1Directory
... make a working directory for Project 1
$ cp /home/cs9311/web/23T1/proj/proj1.sql Project1Directory
```

The only error messages produced by these commands should be those noted above. If you omit any of the steps, then things will not work as planned.

## 5. Important Advice Before You Start

The database instance you are given is not a small one. The first thing you should do is get a feeling for what data is there in the database. This will help you understand the schema better and will make the tasks easier to understand. *Tip: study the schema of each table to see how tables are related and try write some queries to explore/ understand what each table is storing.* 

```
$ psql proj1

proj1=# \d

... study the schema ...

proj1=# select * from Students;

... look at the data in the Students table ...

proj1=# select p.unswid,p.name from People p join Students s on (p.id=s.id);

... look at the names and UNSW ids of all students ...

proj1=# select p.unswid,p.name,s.phone from People p join Staff s on (p.id=s.id);

... look at the names, staff ids, and phone #s of all staff ...

proj1=# select * from dbpop();

... get an idea of the number of records each table has...

proj1=# select * from dbpop();

... how many records in all tables ...

proj1=# ... etcl ttleto S://tutorcs.com

proj1=# \q
```

## Read these before you start on the exercises: CStutorcS

- The marks reflect the relative difficulty/length of each question.
- Work on the project on the supplied proj1.sql template file.
- Make sure that your queries work on any instance of the MyMyUNSW schema; don't customize them to work just on this database; we may test them on a different database instance.
- Do not assume that any query will return just a single result; even if it phrased as "most" or "biggest", there may be two or more equally "big" instances in the database.
- When queries ask for people's names, use the People.name field; it's there precisely to produce displayable names.
- When queries ask for student ID, use the People.unswid field; the People.id field is an internal numeric key and of no interest to anyone outside the database.
- Unless specifically mentioned in the exercise, the order of tuples in the result does not matter; it can always be adjusted using order by. In fact, our check.sql will order your results automatically for comparison.
- The precise formatting of fields within a result tuple **does** matter, e.g., if you convert a number to a string using to\_char it may no longer match a numeric field containing the same value, even though the two fields may look similar.
- We advise developing queries in stages; make sure that any sub-queries or sub-joins that you're using works correctly before using them in the query for the final view/function

- You may define as many additional views as you need, provided that (a) the definitions in proj1.sql are preserved, (b) you follow the requirements in each question on what you are allowed to define.
- If you meet with error saying something like "cannot change name of view column", you can drop the view you just created by using command "drop view VIEWNAME cascade;" then create your new view again.

Each question is presented with a brief description of what's required. If you want the full details of the expected output, look at the expected\_qX tables supplied in the checking script (check.sql) once we release it.

## 6. Tasks

To facilitate the semi-auto marking, please pack all your SQL solutions into view/function as defined in each problem (see details from the solution template we provided).

## Question 1 (4 marks)

Define a SQL view Q1 (subject code):

Give the code of subjects offered by <code>School</code> of <code>Information</code> <code>Systems</code>, <code>Technology</code> and <code>Management</code> that mentions at least one COMP course in its equivalent description. The school name refers to the <code>longname</code> in the related table. The equivalent description refers to the <code>\_equivalentSchool} Project Exam Help</code>

• subject code should be taken from Subjects.code field.

## https://tutorcs.com

#### Question 2 (4 marks)

Define an SQL view Qalleburge id that gives the ideof the courses where all the labs in each course are held in different rooms, where LAB refers to the unswid in the related table. Only consider the courses offered in year 2011 and having the word data(regardless of case) in Subjects.name.

• course id should be taken from Courses.id field.

## Question 3 (4 marks)

Define a SQL view Q3 (unsw\_id, name) that gives all the distinct students who have unwsid started with 3210 and enrolled in at least two courses in one semester. Only consider the courses whose staff involve at least one professor. Professor refers to the Prof in People.title.

- unsw\_id should be taken from People.unswid field;
- name should be taken from People.name field.

### Question 4 (5 marks)

Define an SQL view Q4 (unsw\_id, program) that gives the students and distinct programs they enrolled, where the students should enroll in at least two streams for the same program, and the stream types of programs should involve Major and Research (refers to stream types.description).

- unsw id should be taken from People.unswid field;
- program should be taken from programs.id.

#### Question 5 (5 marks)

Define a SQL view Q5 (unsw\_id, program, course) that gives the students, programs and courses where the program and the course are enrolled in the same term in year 2005 but are offered by different organizations. Only consider the courses that students have achieved 98 (refers to the course enrolments.mark).

- unsw id should be taken from People.unswid field;
- program should be taken from Programs.id field;
- course should be taken from courses.id field.

## Question 6 (5 marks)

Define a SQL view Q6 (school\_id, building\_count) that gives the id of orgunits and number of buildings they used for offered courses in 2011, where the number of buildings is more than School of Mathematics & Statistics (Name of school refers to orgunits.longname). Only consider the courses belonging to subjects that are directly offered by the organization until that the course belonging to subject that are directly offered by the organization until that the course belonging to subject that are directly offered by the organization until that the course belonging to subject that are directly offered by the organization until that the course belonging to subject that are directly offered by the organization until that the course belonging to subject that are directly offered by the organization until that the course is a subject that are directly offered by the organization until that the course is a subject to the course of th

- school id should be taken from Orgunits.id field;
- Return building count as integer.

https://tutorcs.com

#### Question 7 (5 marks)

Define a SQL view Q7 To have the staff name that gives the id of the courses whose classes have the highest number of facilities, and the name of the course\_staff of these courses. Only consider the course staff that are from an organization whose phone number starts with 9382. If a course has more than one course staff, return all of them.

- course id should be taken from Courses.id field;
- staff name should be taken from People.name field.

#### Question 8 (6 marks)

Define SQL view Q8 (unsw\_id, name) that gives all the distinct students who have already graduated as Bachelor and are not eligible to graduate as Master before 2012.

- Bachelor degree refers to the degree type whose name contains the word Bachelor;
- Master degree refers to the degree type whose name contains the word Master.

A student that is valid for graduate should satisfy the following conditions in one program:

- the total UOC (refer to subjects.uoc) earned in the program (exclusive) should be no less than the required UOC of the program (refer to programs.uoc);
- A student can only earn the UOC for a course where he/she has received mark greater than or equal to 60.

The view should return the following details about each student:

- unsw id should be taken from People.unswid field;
- name should be taken from People.name field.

#### Note:

 A course belongs to a program if this student enrolls into course and program in the same semester (refer to Semesters.id).

### Question 9 (6 marks)

Define a PL/pgSQL function Q9 (unswid integer) that takes an unswid of a student and returns the code of courses that the given student enrolled in, the unswid of distinct tutors for these courses and the number of their employed days. Only consider the courses which have at least one same-prefix course as prerequisite.

- Tutor refers to staff roles that includes the word Tutor in its name;
- Same-prefix courses are the courses which have the same first four characters;
- Prerequisite refers to \_prereq in the related table;
- Number of employed days refers to the number of days between the employed date of a staff and the starting date of semester of the given course.

Each line of output (Indext type) should contain the following three elements and they are concatenated with a space:

- A course code should be in front to FC Sie COM
- An unswid should be taken from People.unswid field;
- The number of employed days should be an integer.

## WeChat: cstutorcs

#### Question 10(6 marks)

Define a PL/pgSQL function Q10 (year courseyeartype, term character(2), orgunit\_id integer) that takes a year, a term and an orgunit id. Output the students who enrolled in the program provided by the given orgunit in the given term and had the average mark greater than 85 in the given term, and the average mark.

- year is taken from Semesters.year field;
- term is taken from Semesters.term field;
- orgunit\_id is taken from Orgunits.id field;
- We only count the average mark of passed courses.

Each line of the output (in text type) should contain the following two elements and they are concatenated with a space:

- a unswid of student which is taken from People.unswid field;
- the average mark (as numeric (4,2)) of the related course.

A student passes a course if he/she obtains a grade in {PC, PS, CR, DN, HD} for this course and the mark is not null. If a student did not pass any course in the given term, i.e., the divisor is zero, ignore this student in the output. See check file for examples. We will only test with valid inputs.

## 7. Submission

You can submit this project by doing the following:

- Students must submit an electronic copy of their answers to the above questions to the course website in Moodle.
- The file name should be proj1\_studentID.sql (e.g., proj1\_z5100000.sql).
- If you submit your project more than once, the last submission will replace the previous one
- In case that the system is not working properly, you must take the following actions:
- Please keep a copy of your submitted file on the CSE server. If you are not sure how, please have a look at <u>taggi</u>.

The proj1.sql file should contain answers to all the exercises for this project. It should be completely self-contained and able to load in a single pass, so that it can be auto-tested as follows:

- A fresh copy of the MyMyUNSW database will be created (using the schema from mymyunsw.dump)
- The data in this database may be **different** from the database that you're using for testing
- A new check.sql file may be loaded (with expected results appropriate for the database)
- The contents of your proj1.sql file will be loaded
- Each checking function will be textured on the resultain execution to the resultain execution will be textured on the resultain execution to the resultain execution execution to the resultain execution e

## 8. Check your Answers

Before you submit your question, you have the provide five testing by using something like the following operations. For function questions, we provide five testcases for each question (E.g., for question 10, they are q10a to q10e). Testcases can be found from line215 in check.sql:

WeChat: cstutorcs

```
$ dropdb proj1
                        ... remove any existing DB
$ createdb proj1
                        ... create an empty database
$ psql proj1 -f /home/cs9311/web/23T1/proj/proj1/mymyunsw.dump
                                                                              ... load the
MyMyUNSW schema and data
$ psql proj1 -f /home/cs9311/web/23T1/proj/proj1/check.sql ... load the checking code
                          ... load your solution
$ psql proj1 -f proj1.sql
$ psql proj1
proj1=# select check_q1();
                               ... check your solution to question1
proj1=# select check_q6();
                               ... check your solution to question6
proj1=# select check_q10a();
                               ... check your solution to question10 testcase (a)
proj1=# select check_all();
                               ... check all your solutions
```

#### Notes:

- 1. You must ensure that your proj1.sql file will load and runs correctly (i.e., it has no syntax errors, and it contains all your view definitions in the correct order).
  - a. If your database contains any views that are not available in a file somewhere, you should put them into a file before you drop the database.

- b. If we need to manually fix problems with your proj1.sql file in order to test it (e.g., change the order of some definitions), you will be fined via half of the mark penalty for each problem.
- c. If your code loads with errors, fix it and repeat the above until it does not.
- 2. In addition, write queries that are reasonably efficient.
  - a. For each question, you must output result within 120 seconds on Nw-syd-vxdb server. This time restriction applies to the execution of the 'select \* from check Qn()' calls.
  - b. For each question, you will be fined via half of the mark penalty if your solution cannot output results within 120 seconds.

## 9. Late Submission Penalty

5% reduction (-2.5 out of 50) for each 24 hours after the deadline date and time. Submissions that are more than five days late will not be marked.
